

All-On-Four Mandible

An efficient treatment option

The All-on-4 treatment option replaces your missing teeth with a full dental bridge supported with only four dental implants. With less implants needed, overall treatment time and cost is reduced. The unique technique ensures greater stability in the bone, often reducing the need for bone grafting.

Often the fixed teeth can be placed the same day as the implants

Faster treatment and healing time

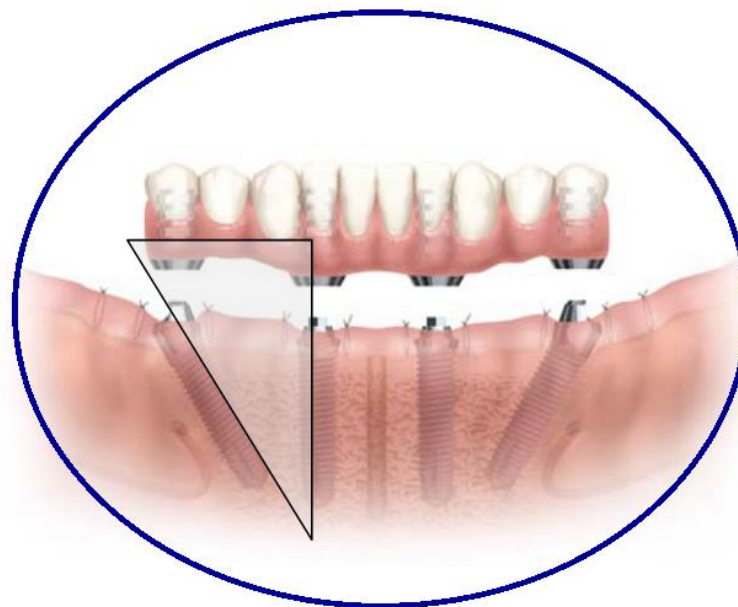

Your replacement arch can be attached to your implants immediately after insertion.

A Cost Effective Solution

Your new replacement teeth require only four implants for each jaw. With few implants and less bone grafting, the cost is lower

Reduced need for bone grafting

The special tilting of two of the implants ensures a secure and stable anchorage for the replaced arch, typically making bone grafting unnecessary

All-on-4 treatment offers patients many advantages

Flexible Options

You can choose a final prosthetic solution that is best for you. Can be removable for ease of cleaning and care or a fixed that is non removable

Scientifically proven and documented

The angled implant, vertical implant and rigid prosthesis form a triangle for strong structure. Implant positioned farther back while avoiding the nerve

Teeth in a Day

Typically the provisional teeth can be fixed in place the same day as the implants.

These provisional teeth look and feel like natural teeth.

Eliminates the need for a denture
